

Assessment of Soils

A **professional soil assessment** examines, among others, the **suitability** of land and agricultural areas for the intended land use, e.g. before concluding a lease or purchase agreement or within the framework of an environmental impact assessment (EIA).

Depending on the issue, this involves evaluating the specific site/soil by means of the examination of physical and chemical parameters and with regard to its functions (e.g. flood protection, biological habitat, etc.). We offer our expertise by covering a broad range of scientific, constructional and agricultural issues.

Range of Parameters:

Depends on the specific question and task.
